Vision

“To make it possible for ALL shipping ports and container depots irrelevant of size, budget or services to be able to implement a software solution that enhances their operational efficiency, reduces data clutter and improves client communication.”

CBS Software

Formed in 1998 and since which time we have been developing, implementing, maintaining and supporting our Port Terminal Operating System throughout Australia and into the Pacific Islands.

Over the years we have as a company gained great knowledge in the working practices of different types and sizes of ports, whose services and methods of implementing those services have been wide ranging.

This has resulted in our PortManager TOS growing to facilitate the handling of all of cargo types including containers, breakbulk and vehicles.

The PortManager solution constantly improves, changes and grows to meet changing client needs, to handle industry changes and to take advantage of new technology.

We feel there is an obligation for us to continue to enhance our solution. This will ensure that current and future clients have the benefits of a TOS that enhances and helps improve the efficiency of their operation.

With the recent release of our DepotManager solution we can further achieve our vision allowing both shipping ports and container parks to benefit from a modern and affordable operational software solution.
